

Focus on excimer technology

The technological focus of the Giardina Group at now postponed Xylexpo 2020 would still have been excimer technology.

"The market now recognises that we have been among the first and most convinced supporters of the potential of this technology", continued Stefano Tibè, commercial director of Giardina Group. "Most of the technologies that we will propose at Xylexpo will involve this topic and, above all, will be perfectly functional, just to demonstrate the maturity that has been achieved with this particular surface treatment. Our "Zero Gloss" drying ovens will work on surfaces painted both with roller and spray gun. These are the two great worlds of painting which we had already talked about on the occasion of the most important exhibitions in the world over the last two years.

In Milan, we wanted present the latest evolutions of these techniques, especially in the case of spray painting and the creation of super opaque surfaces.

Xylexpo could have been the place to present a highly innovative solution linked to the excimer treatments, that is, a drying oven with particular performances that we have been testing in recent weeks and which could represent the "ideal solution" for many painting companies", concluded Tibè.
